

Supplemental Document for "Change Blindness Images"

This supplemental document provides additional user study results for the paper submission entitled "Change Blindness Images".

I. USER STUDY 1

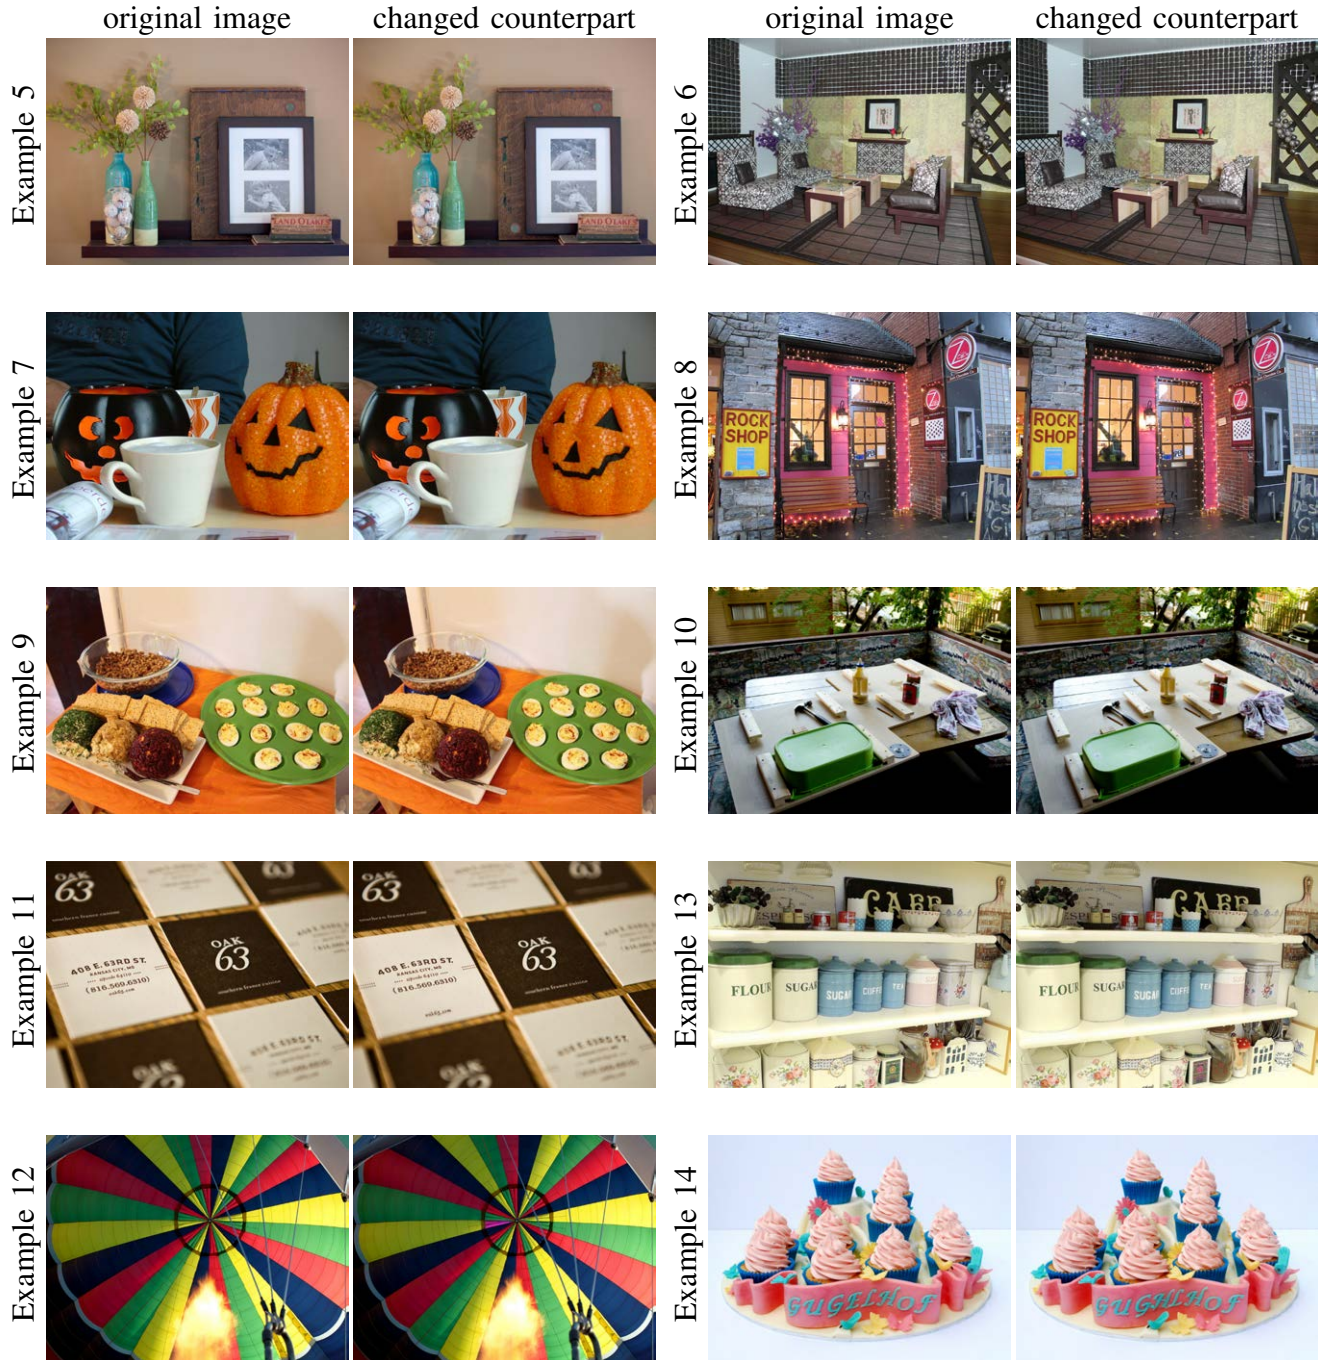

In this section, we provide all the 100 real-world images and the 100 generated changed counterparts that are used in our user study. For each image pair, we provide the predicted blindness by our metric, the predicted recognition time (predicted blindness * 60), the average measured recognition time, intra image (inter subject) standard deviation of the measured recognition times, and the relative error (between the predicted and average measured recognition times). Change locations could be found in Figures 7 & 14.

A. Training Set

Example	1	2	3	4
predicted blindness	0.944	0.915	0.902	0.888
predicted recognition time (s)	56.6	54.9	54.1	53.3
measured recognition time (s)	37.6	50.2	60	56.8
standard deviation (s)	5.4	15.6	11	10.2
relative error(s)	19.0	4.7	-5.9	-3.5

Fig. 1. Examples 1 - 4.

II. USER STUDY 2

As said in the paper, we have modified 6 scenes, with 3 different difficulty levels, by setting desired blindness value B^* as 0.2, 0.5 and 0.8, respectively. we provide all the 6 scenes, and the 18 generated changed counterparts. Change locations could be found in Figure 17.

Fig. 15. Examples 1-4.

Fig. 16. Examples 5-6.

Example	1	2	3	4	5	6	average
recognition time (s)							
$B^* = 0.2$	8.7	19.6	21.9	16.8	13.1	10.0	15.0
$B^* = 0.5$	32.3	40.6	30.8	33.5	17.4	43.9	33.1
$B^* = 0.8$	57.4	48.9	39.5	40.9	38.7	58.5	47.3
